

Lantech

Web UI User's Manual

Industrial 3/5 Switches

Latest update: Sep 2018

Version: 1.53

Important Notice

Lantech Communications Global, Inc. reserves the right to modify the equipment, its specification or this manual without prior notice, in the interest of improving performance, reliability, or servicing. At the time of publication all data is correct for the operation of the equipment at the voltage and/or temperature referred to. Performance data indicates typical values related to the particular product.

No part of this documentation or information supplied may be divulged to any third party without the express written consent of Lantech Communications Global Inc. Products offered may contain software which is proprietary to Lantech Communications Global Inc. The offer or supply of these products and services does not include or infer any transfer of ownership.

Applied Models

This manual applies to Lantech industrial 3/5 managed switches, except the following models: IPGS/IGS-3204MSFP, IPGS/IGS-3008T, IPGS/IGS-3208MGSFP, IPGS/IGS-3208C.

The model list may be changed, Lantech Communications Global, Inc. reserves the right to modify the equipment, its specification or this manual without prior notice.

1.About Web-based Management

There is an embedded HTML web site residing in flash memory on CPU board of the switch, which offers advanced management features and allows users to manage the switch from anywhere on the network through a standard browser such as Mozilla Firefox or Chrome. (note: Window IE is not supported)

The Web-Based Management supports Mozilla Firefox 54.X or later, or Chrome 59.X or later. The Web browser is a program that can read hypertext.

1.1 Preparing for Web Management

Before using the web management, install the industrial switch on the network and make sure that any one of the PCs on the network can connect with the industrial switch through the web browser.

The industrial switch default value of IP, subnet mask, username and password are listed as below:

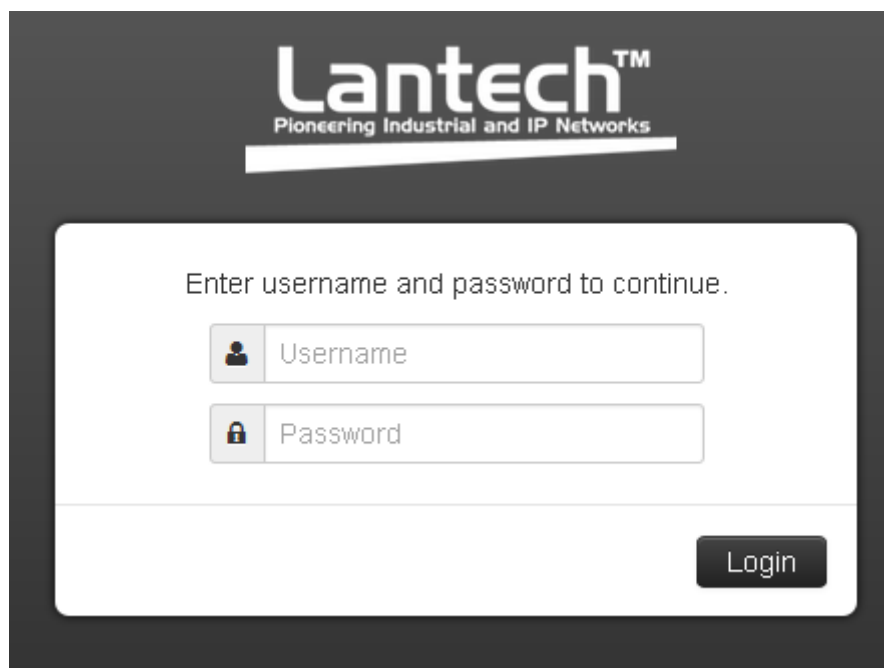

- IP Address: **192.168.16.1**
- Subnet Mask: **255.255.255.0**
- Default Gateway: **192.168.16.254**
- User Name: **admin**
- Password: **admin**

1.2 System Login

1. Launch the Mozilla or Chrome browser on the PC
2. Key in “http://” “+” the IP address of the switch”, and then Press “Enter”.

3. The login screen will appear right after

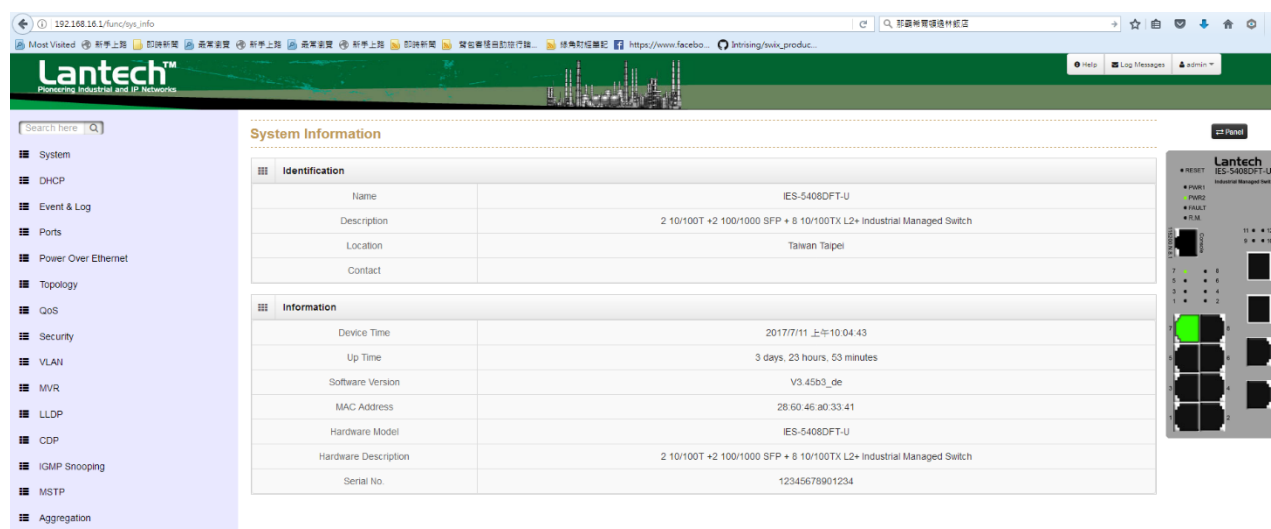

Login screen

4. Key in the user name and password. The default user name and password are the same as '**admin**'.
5. Press **Enter** or click the **OK** button, and then the home screen of the Web-based management appears.
6. The switch also support SSL security login, if you need SSL to protect your access account of switch, please key in "https://" + " the IP address of switch ", and press "Enter"

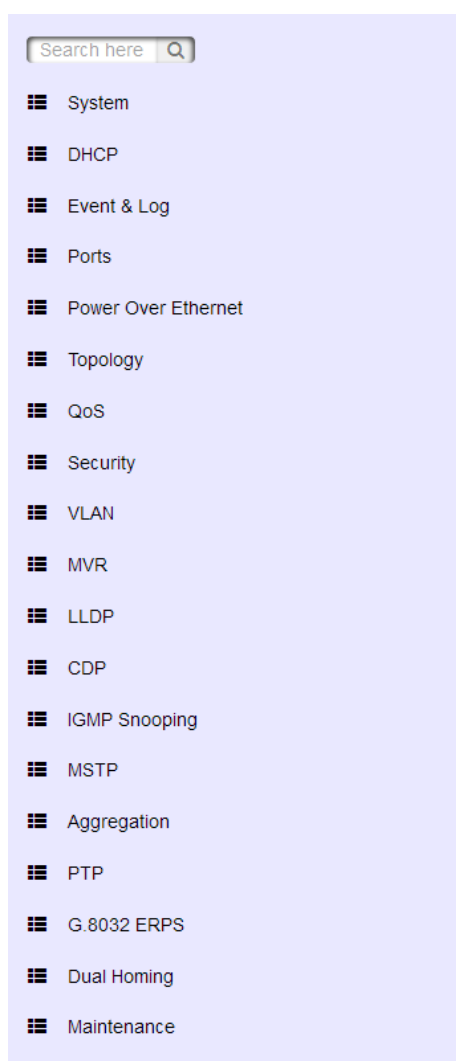

Note: The changes you make in the dialogs will be over-rode to the device when you click "Apply". Remember to save the setting before you power off or reboot the switch.

1.3 Introduction of the Web Interface

The menu section displays the menu items. Use mouse to select function where you want to set and press left button of mouse to enter the function.

2. System

The “System” submenu consists of the followings:

- System Configuration
- System Information
- IP Configuration
- System Time
- User Accounts
- AAA Configuration
- SNMP Configuration
- Fault Relay Alarm
- Digital Input/Output
- Environment Monitoring
- Auto Provision

2.1 System Configuration

This section displays the system parameters of the device. You can change the following parameters:

- the system name
- the system description
- the location description
- the name of the contact person for this device
- the value of auto logout time

System Identification Configuration

① Name:

② Description:

③ Location:

④ Contact:

⑤ Auto Logout Time: minutes
0 means disabling auto logout

① Name:	An administratively assigned name which defined by system. It CAN'T be edit manually.
② Description:	Display the description of switch. The allowed string length is 0 to 255.
③ Location:	The physical location of this node (e.g., telephone closet, 3rd floor). The allowed string length is 0 to 255, and the allowed content is the ASCII characters from 32 to 126.
④ Contact:	The textual identification of the contact person for this managed node, together with information on how to contact this person. The allowed string length is 0 to 255, and the allowed content is the ASCII characters from 32 to 126.
⑤ Auto Logout Time:	Define how long the switch has not received any command from end user via web service, switch will cut off the session between web server with the client. 0 means to disable the auto logout service.

2.2. Switch Information

This function will show you the basic information of switch.

System Information

Identification		
①	Name	IPES-3416DSFP
②	Description	4 100/1000 SFP +16 10/100TX L2+ Industrial Managed Switch
③	Location	Taiwan Taipei
④	Contact	
Information		
⑤	Device Time	1970/1/17 上午2:23:31
⑥	Up Time	41 minutes
⑦	Software Version	V3.43r61
⑧	MAC Address	28:60:46:a0:3b:22
⑨	Hardware Model	IPES-3416DSFP
⑩	Hardware Description	4 100/1000 SFP +16 10/100TX L2+ Industrial Managed Switch

Identification

Name	Description
① Name:	System name of this device
② Description:	Description of this device
③ Location:	Location of this device
④ Contact:	The contact for this device

Information

Name	Description
⑤ Device Time:	System time of switch
⑥ Up Time:	Time that has elapsed since this device was restarted.
⑦ Software Version:	Software version of switch system
⑧ MAC Address:	Media Access Control address of switch

⑨ Hardware	Model name of switch
-------------------	----------------------

Model:

⑩ Hardware	Description of switch model
-------------------	-----------------------------

Description:

2.3. IP configuration

The IPv4 settings include the switch's IP address and subnet mask, as well as the IP address of the default gateway.

① DHCP client:	<input type="checkbox"/>
② IP Address:	<input type="text" value="192.168.16.1"/>
③ IPV6 Address:	<input type="text"/>
④ Network Mask:	<input type="text" value="255.255.255.0"/>
⑤ Default Gateway:	<input type="text" value="192.168.16.254"/>
⑥ DNS Server IP:	<input type="text" value="8.8.8.8"/>

Apply

Name	Description
① DHCP client:	Set the switch as DHCP client, it will get the IP address from DHCP server.
② IP Address:	Input the IP address of switch
③ IPV6 Address:	You can input the IP address of IPV6 standard.
④ Network Mask:	The network mask of IP address.
⑤ Default Gateway:	The IP address of network gateway, if you need switch to connect with internet, please input correct IP address.

-
- ⑥ DNS Server** The IP address of DNS server, if you need switch to enable internet service (like SNTP), please input correct IP address.
-

2.4. System Time

Network Time Protocol (NTP) is a networking protocol for clock synchronization between computer systems over packet-switched, variable-latency data networks. NTP is intended to synchronize all participating computers to within a few milliseconds of Coordinated Universal Time (UTC). It uses the intersection algorithm, to select accurate time servers and is designed to mitigate the effects of variable network latency. NTP can usually maintain time to within tens of milliseconds over the public Internet, and can achieve better than one millisecond accuracy in local area networks under ideal conditions. Asymmetric routes and network congestion can cause errors of 100 ms or more.

Note: This section is taken from Wiki at

https://en.wikipedia.org/wiki/Network_Time_Protocol

① Time Zone: Select an Option

② Clock Source SNTP

Manual
SNTP

Device Time 2015年03月01日 下午 11:09:20

③ NTP Server: ntp.ubuntu.com

Name	Description				
① Time Zone:	Universal Time Coordinated. Set the switch location time zone. The following table lists the different location time zone for your reference.				
	<table border="1"> <thead> <tr> <th>Variants</th><th>Default Setting</th></tr> </thead> <tbody> <tr> <td> </td><td> </td></tr> </tbody> </table>	Variants	Default Setting		
Variants	Default Setting				

	Please refer to the "Table: Location Time Zone" below	None
② Clock Source:	You can set the time of switch manually or set SNTP server to let the switch synch the time with SNTP server via internet.	
	Variants	Default Setting
	Manual, SNTP	SNTP
③ SNTP server:	The IP address of SNTP server.	

Manual Mode: If the switch can't access internet for security issue, you can set manual mode of clock source to correct system time of switch, just press "get browser time" then the system time of switch will be synchronized with your desktop via web browser.

Device Time Configuration

Clock Source

Device Time 2017/7/11 上午10:46:06

Time 

Note: For the most accurate system time distribution possible, only use network components (routers, switches, hubs) which support SNTP in the signal path between the SNTP server and the SNTP client.

Table: Location Time Zone

Local Time Zone	Conversion from UTC	Time at 12:00 UTC
November Time Zone	- 1 hour	11am

Oscar Time Zone	-2 hours	10 am

IDLE - International Date Line NZST - New Zealand Standard NZT - New Zealand	+12 hours	Midnight

2.5. User Accounts

This dialog gives you the option of changing the read and read/write passwords for access to the device via the Web-based interface and via the CLI. Please note that passwords are case-sensitive. Set different passwords for the read and the read/write so that a user that only has read access (user name “user”) or read/write access (user name “admin”). If you set identical password for both that will incur a general error.

User Accounts

2 New User

ID	1 Password	3 Permission	
admin	<input type="password" value="....."/>	Read-Write v	
user	<input type="password" value="....."/>	Read-Only v	

Apply

Name	Description				
① Password:	Reset the password of an account				
② New User:	Press to add new account				
③ Permission:	Set the permission level of an account				
	<table> <tr> <th>Variants</th><th>Default Setting</th></tr> <tr> <td>Read-Write, Read-Only</td><td>Read-Write</td></tr> </table>	Variants	Default Setting	Read-Write, Read-Only	Read-Write
Variants	Default Setting				
Read-Write, Read-Only	Read-Write				

2.6. SNMP Configuration

Lantech switch supports SNMP V1, V2c, and V3. SNMP V1 and SNMP V2c use a community string match for authentication in which the SNMP servers access all objects with read-only or read/write permissions using the community strings public and private by default. SNMP V3 requires you to select an authentication level of MD5 or SHA which is the most secure protocol. You can also enable data encryption to enhance data security.

SNMP Configuration

Community
Trap
V3 Users

① Agent Version: V1 / V2c / V3

Response Locale: Unicode (UTF-8)

② String	Permission
public	Read Only
private	Read/Write
<input type="text" value="Community String"/> Please enter a valid value.	<input checked="" type="checkbox"/> Read Only

Apply

-------------------------------	---	---	---	----------------------------------	----------------------------------

Apply

V3 Users

Name	Description
① User name:	Set the user name.
② Security Level:	Set up the access level, you can choose Authentication or Privacy or Both.
③ Authentication	Set the authenticated way, the default value was MD5

Protocol:

④ Authentication Set the password of authentication.

Password:

⑤ Privacy protocol: Set the security way, the default value is DES.

⑥ Privacy Set the password of Privacy.

Password:

Note: For security reasons, SNMPv3 encrypts the password. With the “SNMPv1” or “SNMPv2” setting in the dialog, Security: SNMPv1/v2 access, the switch transfers the password unencrypted that will be shown and readable.

2.7. Fault Relay Configuration

This section allows you to set the condition to trigger Alarm Relay of the switch, including power failure and the linking status of ports.

Fault Relay Configuration

	Power Failure ①
<input type="checkbox"/> Power 1	<input type="checkbox"/> Power 2

	Port Link Down/Broken ②					
<input type="checkbox"/> Port 1	<input type="checkbox"/> Port 2	<input type="checkbox"/> Port 3	<input type="checkbox"/> Port 4	<input type="checkbox"/> Port 5	<input type="checkbox"/> Port 6	<input type="checkbox"/> Port 7
<input type="checkbox"/> Port 8	<input type="checkbox"/> Port 9	<input type="checkbox"/> Port 10	<input type="checkbox"/> Port 11	<input type="checkbox"/> Port 12		

[Apply](#)

Name	Description
① Power Failure:	When you connect both the PWR1 and PWR2 with switch, should one of them fail, the alarm relay will be triggered.
② Port Link Down/Broken:	Choose the port (one or more) to trigger the alarm relay when the connection fails.

2.8. Digital Input/ Digital Output (DIDO)

This switch contains two digital outputs and two digital inputs. Outputs are open-collector transistor switches that may be controlled by the host computer. They provide messages, which can be applied to heaters, pumps, and other electrical equipment. The digital inputs may be read by the host computer and used to sense the state of a remote digital signal.

Digital Input/Output

Digital Input

DIN 1 ☒ High -> Low ▼

DIN 2 ☒ Low -> High ▼

Digital Output

DOUT 1 ☒ Low -> High ▼

DOUT 2 ☒ High -> Low ▼

Digital Input

When First/Second Digital Input function is enabled, First Digital Input/Second Digital Input will then be available respectively. Digital Input: Choose the transition type to trigger DI0/DI1.

Name	Description
Low->High:	Having focused this radio button, DI0/DI1 will only report the status when the external device's voltage changes from low to high.
High->Low:	Having focused this radio button, DI0/DI1 will only report the

status when the external device's voltage changes from high to low.

Event Please fill in the description for the event.

Description:

Digital Output

When First/Second Digital Output function is enabled, First Digital Output/Second Digital Output will then be available respectively.

Name	Description
Action:	Choose the output type of electrical signal.
Low->High:	Having focused this radio button, DO0/DO1 will output an electrical signal of Low-to-High when the condition of the ticked checkbox is met (port/power failure occurs).
High->Low:	Having focused this radio button, DO0/DO1 will output an electrical signal of Low-to-High when the condition of the ticked checkbox is met (port/power failure occurs).

2.9. Environmental Monitoring

This function is optional and only support M series.

2.10. Auto Provision

Auto provision can help switch to obtain new configuration or upgrade firmware remotely by TFTP protocol.

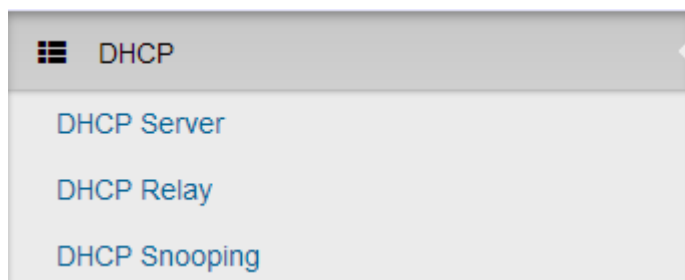

Auto Provision

Auto Install Configuration File	
①	<input checked="" type="checkbox"/> Auto install configuration file from TFTP server
②	TFTP server IP address <input type="text" value="0.0.0.0"/>
③	File name <input type="text"/>

Auto Install Firmware Image File	
④	<input checked="" type="checkbox"/> Auto install firmware image file from TFTP server
⑤	TFTP server IP address <input type="text" value="0.0.0.0"/>
⑥	File name <input type="text"/>

Name	Description
① Auto install configuration file from TFTP server:	Enable switch Auto Provision to get configuration remotely.
② TFTP server IP address:	IP address of TFTP server.
③ File name	File name of configuration file.
④ Auto install firmware image file from TFTP server:	Enable switch Auto Provision to upgrade firmware remotely.
⑤ TFTP server IP address:	IP address of TFTP server.
⑥ File name	File name of firmware.

3.DHCP

This section contains the dialogs, displays and tables for:

- Basic DHCP Server
- Mac-based DHCP
- DHCP Option 66
- DHCP Option 82
- Port-based DHCP
- DHCP Status
- DHCP Snooping

3.1.Basic DHCP Server

DHCP Server

Basic MAC-based Option66 Option82 Port-based Status

1 Enable DHCP Server ☒

2 IP Range ?

3 Subnet Mask

4 Gateway

5 DNS

6 Lease Time

Name	Description
① Enable	Click to enable the DHCP server function of switch.
DHCP Server:	
② IP Range:	Define the IP range which will assign to DHCP client from switch.
③ Subnet Mask:	Define the Subnet Mask which will be assigned to DHCP client.
④ Gateway:	Define the gateway which will be assigned to DHCP client.
⑤ DNS:	Define the DNS which will be assigned to DHCP client.
⑥ Lease Time:	Define the effective time of assigned IP address; the DHCP client will apply the IP again from DHCP server when the time is over.

3.2. Mac-based DHCP

Assign dedicated IP address to the client with dedicated MAC address via DHCP service.

DHCP Server

Basic | **MAC-based** | Option82 | Port-based | Status

MAC Address	IP Address
① 28:60:46:A1:35:2c	② 192.168.16.123

Apply

Name	Description
① Mac Address:	MAC address of dedicated device which you want to assign dedicated IP.
② IP Address:	Dedicated IP address assigned by DHCP server

3.3. DHCP Option 66

Assign dedicated IP of TFTP server under DHCP option66 standard.

Basic MAC-based Option66 Option82 Port-based Status

① Server

Apply

Name	Description
① Server:	IP address of TFTP server

3.4. DHCP Option 82

Assign dedicated IP address under DHCP option82 standard; you need to assign one Lantech switch as option82 server and other Lantech switches as DHCP relay.

Basic MAC-based Option66 Option82 Port-based Status

① Remote ID <input type="text" value="286046a03b22"/>	② Circuit ID <input type="text" value="00010001"/>	③ IP Range Low IP Range <input type="text"/> Max IP Range <input type="text"/>	④ Netmask <input type="text"/>	⑤ Gateway <input type="text"/>	⑥ DNS <input type="text"/>	⑦ Lease Time <input type="text" value="8640"/> <input type="button" value="+"/>
--	---	--	-----------------------------------	-----------------------------------	-------------------------------	--

ⓘ To distribute IP address via DHCP Option 82 service, there must be one stand alone switch acting as server while others being of relay agents role

Name	Description
① Remote ID:	ID of remote DHCP option82 relay switch
② Current ID:	ID of port of remote DHCP option82 relay switch
③ IP Range:	IP address range will be assigned via current ID
④ Netmask:	Assigned netmask
⑤ Gateway:	Assigned gateway
⑥ DNS:	Assigned DNS
⑦ Lease Time:	Lease time of released DHCP IP address

With Option 82, a DHCP relay agent (Lantech Switch) receiving a DHCP request without Option 82 field will add an "Option 82" field to the request.

3.5. Port-based DHCP

Assign dedicated IP address by port that is connected to the device.

Basic MAC-based Option82 Port-based Status

① Port No.	② Desired IP	③
1	IPv4 Address	<input type="checkbox"/> Do not offer IP

Name	Description
① Port No.:	Switch port number connecting to the device
② Desired IP:	Dedicated IP address which will be assigned via this port
③ Do not offer IP:	This port will not assign IP address to ending device

3.6. DHCP Status

It will show you what IP address has been assigned to client.

Basic MAC-based Option82 Port-based Status

Clients

① Port No	② MAC Address	③ IP Address	④ Name	⑤ Available Leased Time
-----------	---------------	--------------	--------	-------------------------

Name	Description
① Port No.:	Switch port number
② Mac Address:	MAC address of ending device
③ IP Address:	IP address of ending device
④ Name:	Host name of ending device
⑤ Available Leased Time:	How long this IP address will be renewed with DHCP server.

3.7.DHCP Snooping

Set dedicated port to forward DHCP packets or block malicious DHCP traffic.

DHCP Snooping

Name	Description				
① Enable	Activate DHCP Snooping function				
DHCP Snooping:					
② Port No.:	Switch port number				
③ Mode:	<p>Trusted: This port will forward DHCP packets.</p> <p>Untrusted: This port will block DHCP packets.</p> <table> <tr> <th>Variants</th><th>Default Setting</th></tr> <tr> <td>Trusted, Untrusted</td><td>Untrusted</td></tr> </table>	Variants	Default Setting	Trusted, Untrusted	Untrusted
Variants	Default Setting				
Trusted, Untrusted	Untrusted

③ DDM:	DDM information from SFP module
④ Din:	Digital Input Event is triggered
⑤ Link Change:	Port link up or down
⑥ Power:	Power condition

Note: The maximum log entry is 1000. When the log exceeds 1000, it will reshuffle from the oldest entry.

4.2. Events

This function will help you to check the status of the following items.

- Environment Monitoring Event
- SFP Digital Diagnostic Monitor Event

4.2.1. Environment Monitoring Event

You can set the desired triggered range of each event, for example, when you set the blue bar in the range from 20V to 50V, should the voltage of power input is over 50VDC or below 20VDC, it will trigger the event system.

Env Monitor Best

Name	Description
① Temperature:	Working Temp. of SFP
② Voltage:	Working voltage of SFP
③ TX Bias:	Bias of SFP
④ TX Power:	Tx power of SFP
⑤ RX Power:	Rx power of SFP

Notice: This function only works for the SFP module with DDM spec.

4.3. Actions

When switch find event, it will trigger the follow-by action pre-set.

You can find all reactive actions as follows:

- Local Log Action
- Remote Syslog Action
- Email Action
- SNMP Trap Action
- SMS Action
- DOUT Action

4.3.1. Local Log Action

Name	Description
① Save to Local:	Click to save log to local switch

4.3.2. Remote Syslog Action

The “Syslog” dialog enables you to additionally send event to one or more syslog servers locating local or remote. You can switch the function on or off.

Local Log Action Remote SysLog Action Email Action

① ☒ Log to Remote Syslog Server

② Syslog Server: 0.0.0.0

③ Tag: node-event

④ Facility: user

⑤ Host Name: host

Name	Description
① Log to Remote Syslog Server:	Click to save log to Syslog Server
② Syslog Server:	IP address of Syslog server
③ Tag:	Tag of event
④ Facility:	Facility of event
⑤ Host Name:	Host name of event

4.3.3. Email Action

Local Log Action Remote SysLog Action **Email Action** SNMP Trap Action SMS Action DOut Action

① ☒ Email Alert

② Subject: Event Log

③ Cloud SMTP: ☒

④ Receivers:

Please enter at least one receiver

Name	Description
① Email Alert:	Click to sent log alert via Email
② Subject:	Subject of email
③ Cloud SMTP:	Send Email via Lantech Cloud SMTP server
④ Receivers:	Email address of event receiver

4.3.4. SNMP Trap Action

Local Log Action Remote SysLog Action Email Action **SNMP Trap Action** SMS Action DOut Action

Please refer to [SNMP Trap](#)

Name	Description
SNMP Trap Action:	The setting page of this function will be redirect to SNMP configuration of System.

4.3.5. SMS Action

Name	Description
① SMS Alert:	Click to send log alert via SMS service.
② User ID:	User name of SMS account
③ Password:	Password of SMS account
④ Sender Text:	Content of SMS message
⑤ Phone Numbers:	Cell-phone number of recipient

Note: The switch must connect with internet and define the SMS server to activate this service. Currently the SMS service is offered by Lantech in Taiwan.

4.3.6. DOUT Action

Name	Description
DOUT Action:	The setting page of this function will be redirect to Digital Input/Output configuration

4.4 Event Action Map

You can combine event and action setting here.

Event Action Map

Event Actions:

Choose an Event to Add

Event Actions for Link Change:

Choose an Event to Add

Event Actions:

Please follow the steps below to set the event actions:

A. Choose the event which you want to activate.

Event Action Map

Event Actions for: 1 Choose an Event to Add

Event Actions for: add

Event Actions for: POE port to Add

Name	Description	Variants	Default setting
1 Event Actions:	Which event will be combined with desired action	Boot EnvMon POE-A ping fail Ring DDM Login fail Login success DIN1 DIN2 Power1 on Power1 off Power2 on Power2 off	None

B. You will find the selected event to be shown as follows, then choose forwarding method to define how to forward this event to manager side.

Event Actions:

Boot: Boot:

EnvMon: EnvMon:

Syslog x

- Email
- SMS
- SNMP Trap
- DOUT 1
- DOUT 2

Name	Description	Variants	Default setting
①	Which action will be	Email	None
Forwarding method:	combined with this event	SMS	
		SNMP Trap	
		DOUT 1	
		DOUT 2	

C. You can set the forwarding method of port up/down event here.

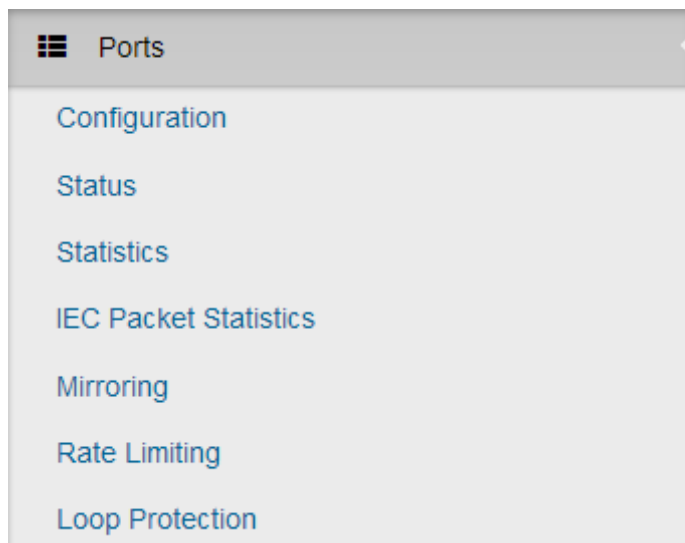

Event Actions for Link Change:

- Port 1 up
- Port 1 down
- Port 2 up
- Port 2 down
- Port 3 up
- Port 3 down
- Port 4 up
- Port 4 down

Name	Description	Variants	Default setting
① Event	Select dedicated port link or	Port 1 up	None

Actions	down event to combine action	Port 1 down
for Link		Port 2 up
Change:		Port 2 down
		Port 3 up
		Port 3 down
		Port 4 up
		Port 4 down
	etc

5. Ports

This section guides how to control and manage the ports of switch.

5.1 Configuration

Device Settings panel shows port configurations and each port can be configured here.

Device Settings

Port No.	Type	Description	Enabled	Flow Control	Speed
1	100TX	Port 1	<input checked="" type="checkbox"/>	<input type="checkbox"/>	Auto
2	100TX	Port 2	<input checked="" type="checkbox"/>	<input type="checkbox"/>	Auto

Name	Description
① Port No.:	Number of the port.
② Type:	Media type of the port (100Tx/1000T/GSFP/DSFP).
③ Description:	Enter up to 47 characters to describe the port for better identification.
④ Enabled:	Enabled or disable port transmission.

⑤ Flow Enabled or disable flow control.

Control:

⑥ Speed: Select the speed of the port. Only supported speed would be shown as an option.

Options	Default Setting
Disabled – Deactivate the port.	Auto
Auto – Let the port to negotiate the speed with the linking device and reach the maximum speed that is possible.	
10Mbps HDX - Forces the cu port in 10Mbps half duplex mode.	
10Mbps FDX - Forces the cu port in 10Mbps full duplex mode.	
100Mbps HDX - Forces the cu port in 100Mbps half duplex mode.	
100Mbps FDX - Forces the cu port in 100Mbps full duplex mode.	
1Gbps FDX - Forces the cu port in 1Gbps full duplex mode.	

5.2 Status

Port Status

Port No. ①	Type ②	Link ③	State ④	Speed ⑤	Flow Control ⑥
1	100TX	up	Enable	100 Full	Disable
2	100TX	down	Enable	N/A	N/A

Name	Description
① Port No:	Number of the port.
② Type:	Media type of the port (100Tx/1000T/GSFP/DSFP).
③ Link:	Link status: up or down.
④ State:	State of port linking status.
⑤ Speed:	The speed of link (detailed description may refer to page 32 Possible Options).
⑥ Flow Control:	Status of Flow Control. *Flow Control is only available when the speed of port is set to Auto and therefore its efficiency is subject to the negotiation between the port and the linking device.

5.3 Statistics

Port Statistic

① Port	② Type	③ Link	④ State	⑤ TX Good	⑥ TX Bad	⑦ RX Good	⑧ RX Bad	⑨ TX Abort	⑩ Collision	⑪ Drop	⑫ RX BCAST	⑬ RX MCAST	⑭ TX MCAST
1	DSFP	Down	Enable	0	0	0	0	0	0	0	0	0	0
2	DSFP	Down	Enable	0	0	0	0	0	0	0	0	0	0
3	DSFP	Down	Enable	0	0	0	0	0	0	0	0	0	0
4	DSFP	Down	Enable	0	0	0	0	0	0	0	0	0	0

Name	Description
① Port:	Number of each port.
② Type:	Media type of each port (100Tx/1000T/GSFP/DSFP).
③ Link:	Link status: Up or Down.

④ State:	Port status: Enable or not
⑤ Tx Good Packet:	The counts of transmitting good packets via this port.
⑥ Tx Bad Packet:	The counts of transmitting bad packets (including undersize [less than 64 octets], oversize, CRC Align errors, fragments and jabbers packets) via this port.
⑦ Rx Good Packet:	The counts of receiving good packets via this port.
⑧ Rx Bad Packet:	The counts of receiving good packets (including undersize [less than 64 octets], oversize, CRC error, fragments and jabbers) via this port.
⑨ Tx Abort Packet:	The aborted packet while transmitting.
⑩ Packet Collision:	The counts of collision packet.
⑪ Packet Dropped:	The counts of dropped packet.
⑫ Rx Bcast Packet:	The counts of broadcast packet.
⑬ Rx Mcast Packet:	The counts of multicast packet.
⑭ Tx Mcast:	The counts of transferring multicast packet.

5.4 Mirroring

Port Mirroring is a method of monitoring network traffic. With port mirroring enabled, the switch sends a copy of all network packets seen on some ports (Source Port) to another port (Destination Port), where the packet can be analyzed.

Source Port: The port(s) that is/are to be monitored. The monitored port(s) traffic will be copied to Destination Port.

Destination Port: There is only one port can be assigned as Destination Port for monitoring both RX and TX traffic which come from source port(s).

Port Mirroring

Direction	Destination	Mirror From
① RX	② Port 1	③ Choose ports
TX	Port 1	Choose ports

Name	Description
① Direction:	Choose to monitor only the packets coming in (RX) or sending out (TX) via the port.
② Destination:	Choose the port which receives monitoring packets.
③ Mirror From:	Choose the port(s) which to be monitored.

5.5 Rate Limiting

Rate Limiting allows setting limit of each port's ingress/ egress rate.

Ingress control supports limit of packet type and rate, there are 4 packet types for selection: All, Unicast, Multicast and Broadcast.

Egress control supports limit of rate only.

Rate Limiting

Port	Ingress	Egress
1	① Unicast Multicast Broadcast 0 ② kbps 0%	0 ③ kbps 0%
2	Unicast Multicast Broadcast 0 kbps	0 kbps

Name	Description							
① Band Width:	<p>All the ports support port ingress and egress rate control. For example, assume port 1 is 10Mbps, users can set its effective egress rate is 1Mbps, ingress rate is 500Kbps. The switch performs the ingress rate by packet counter to meet the specified rate.</p> <table border="1"> <thead> <tr> <th>Packet Types</th><th>Default Setting</th></tr> </thead> <tbody> <tr> <td>1. All</td><td rowspan="4">All</td></tr> <tr> <td>2. Unicast</td></tr> <tr> <td>3. Multicast</td></tr> <tr> <td>4. Broadcast</td></tr> </tbody> </table>	Packet Types	Default Setting	1. All	All	2. Unicast	3. Multicast	4. Broadcast
Packet Types	Default Setting							
1. All	All							
2. Unicast								
3. Multicast								
4. Broadcast								
② Ingress:	Enter the limit of ingress rate (The default value is "0")							
③ Egress:	Enter the limit of egress rate (The default value is "0")							

Note: Rate Limiting works exclusively on layer 2 to serve the purpose of limiting the impact of flooding packets. Therefore, this function ignores any protocol information of higher layers like IP or TCP.

Note: Ports that are included in a Link Aggregation are excluded from the rate limitation, regardless of the entries in the "Rate Limiting" dialog.

5.6 Loop Protection

Loop Protection helps to prevent the broadcast storm which caused by loop connection.

Loop Protection

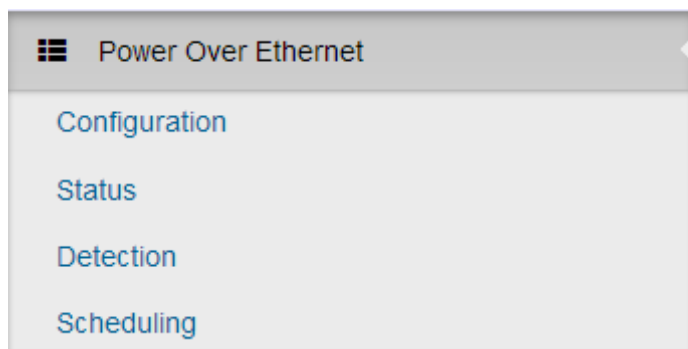

Name	Description
① Enable Loop Protection:	Enable or disable loop protection.
② Interval (second):	Define how often the switch will check the loop status of each port.
③ Shutdown (second):	Define how long the port will be blocked when it is looping.

Loop Protection

<div> <div>Config</div> <div>Status</div> </div>			
Port No	Looping ①	Loop Counts ②	Last Loop at ③
1	NO	0	N/A
2	NO	0	N/A
3	NO	0	N/A
4	NO	0	N/A

Name	Description
① Looping:	Loop status of the port.
② Loop Counts:	Show how many loops happened to the port.
③ Last Loop at:	Show the time of the last loop happened.

6.Power over Ethernet

Power over Ethernet (PoE) is a way to transmit power over Ethernet cable to PD (Powered devices). The standards are IEEE 802.3at/af with different power output. The IEEE802.3af can transmit max 15.4W per port while IEEE802.3at, also known as PoE+, transmit 30W per port. In the physical connection of PoE technology, please consider power loss over the length of cable. The minimum power available is 12.95Watts per port over IEEE802.3af and 25.5Watts per port over IEEE802.3at standard.

There are several common techniques for transmitting power over Ethernet cabling. Two of them have been standardized by IEEE 802.3 since 2003. These standards are known as *Alternative A* and *Alternative B*. For 10BASE-T and 100BASE-TX, only two of the four data/signal pairs in typical CAT-5 cable are used. **Alternative B** separates the data and the power conductors, making troubleshooting easier. It also makes full use of all four twisted pair, copper wires. The positive voltage runs along pins 4 and 5, and the negative along pins 7 and 8.

Note: This part is taken from Wiki at https://en.wikipedia.org/wiki/Power_over_Ethernet

Lantech supports most PoE switch as PSE (power sourcing equipment) using Alternative A technique. Only a couple of models support Alternative B technique.

Lantech PoE models have options with different input range including 12/24V→48V boost up, 72V →48V step down and high voltage 85~265VAC/ 110~300VDC. Furthermore, Lantech managed PoE switches offer PD detection and PoE scheduling

for advanced PoE management.

Note: PoE is an optional hardware function, Lantech PoE switch (PSE Power Sourcing Device) supports different input voltage to feed 48V PoE output with different PoE budget, please check your model for correct input range and PoE budget before you connect to PDs.

6.1 Configuration

Power over Ethernet Configuration

Port No.	Enabled	Scheduling	Priority	Power Limit(<= 36000)
1	<input checked="" type="checkbox"/>	<input type="checkbox"/>	LOW	36000 mW

Refer to above screenshot, Sunday at 10 o'clock is ticked which means the switch will power the PD from AM10:00 to AM10:59 on Sunday.

7.Topology

This function gives user a graphical overview of the entire network topology. However, the LLDP function of all the connected switches must be activated to work this out.

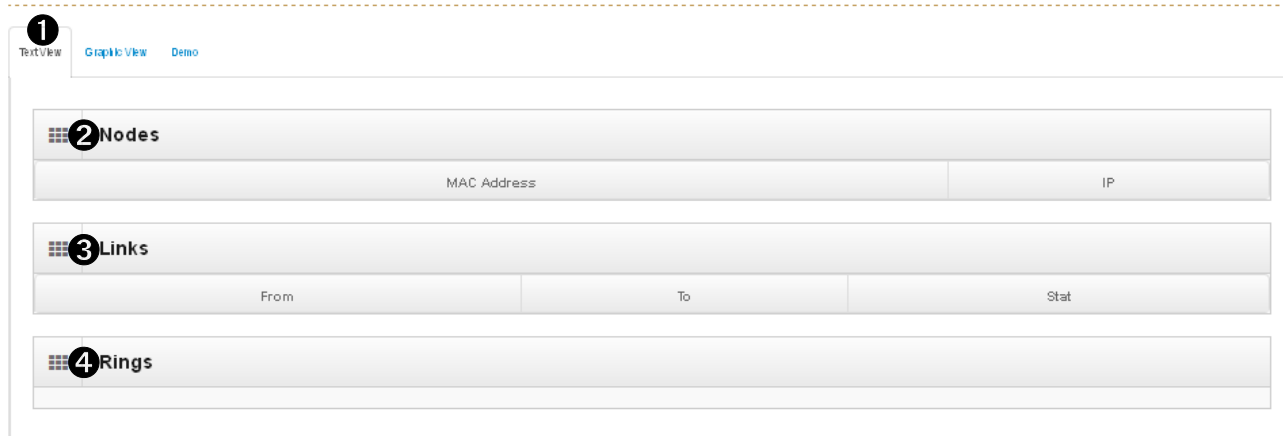

Topology Status

Warning!

Please [Enable LLDP](#) to see topology status

Topology Status

Topology Status

Name	Description
① Text View:	Display LLDP information of each switch by text.
② Nodes:	Show the detailed information of each node (switch), such as MAC address and IP address.
③ Links:	Show the status of each connection.
④ Rings:	Show the information from ITU-Ring.

Topology Status

Name	Description
① Graphic View:	Display graphical overview of network topology which built by the LLDP information.
② Physical:	Show only physical connections of the network.
③ Ring:	Show both of physical and ITU-Ring connections of the network.

Topology Status

Topology Status will show the example of different topologies.

8.QoS

Quality of service (QoS) is the description or measurement of the overall performance of a service, such as a telephony or computer network or a Cloud computing service, particularly the performance seen by the users of the network. To quantitatively measure quality of service, several related aspects of the network service are often considered, such as error rates, bit rate, throughput, transmission delay, availability, jitter, etc.

In the field of computer networking and other packet-switched telecommunication networks, quality of service refers to traffic prioritization and resource reservation control mechanisms rather than the achieved service quality. Quality of service is the ability to provide different priority to different applications, users, or data flows, or to guarantee a certain level of performance to a data flow.

Quality of service is particularly important for the transport of traffic with special requirements. In particular, developers have introduced technology to allow computer networks to become as useful as telephone networks for audio conversations, as well as supporting new applications with even stricter service demands.

Note: This section is taken from Wiki at https://en.wikipedia.org/wiki/Quality_of_service

QoS Policy

The hardware of Lantech switches has multiple traffic queues that allow packet prioritization to occur. Higher priority traffic can pass through the Lantech switch without being delayed by lower priority traffic. As each packet arrives in the Lantech switch, it passes through any ingress processing, and is then sorted into the appropriate queue. The switch then forwards packets from each queue. Lantech

switches support two different queuing mechanisms:

- **Weighted Fair Queue Ratio:** This method services all the traffic queues, giving priority to the higher priority queues. Under most circumstances, the Weighted Fair Queue Ratio gives high priority precedence over low priority, but in the event that high priority traffic does not reach the link capacity, lower priority traffic is not blocked.
- **Strict:** This method services high traffic queues first; low priority queues are delayed until no more high priority data needs to be sent. The Strict method always gives precedence to high priority over low priority.

QoS Configuration

QoS Policy:

Use weighted fair queuing scheme ☒

Priority Type Disabled

Weighted Fair Queue Ratio

Traffic 0	Traffic 1	Traffic 2	Traffic 3	Traffic 4	Traffic 5	Traffic 6	Traffic 7
1	1	1	1	1	1	1	1

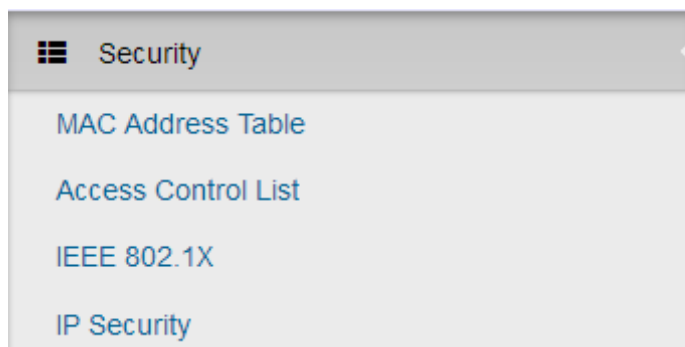

Apply

Name	Description
① Using the weight fair queue scheme:	The switch will follow 8:7:6:5:4:3:2:1 rate to process priority queue from High to lowest queue.
② Priority Type:	<ul style="list-style-type: none"> ■ Port-base: the port priority will follow the default port priority that you have assigned - High, center, low, or lowest. ■ CoS: the port priority will only follow the CoS priority that you have assigned. ■ ToS only: the port priority will only follow the ToS priority that you have assigned. ■ ToS first: the port priority will follow the ToS priority first, and the other priority rule.

- **Port-based:** Set the priority of traffic by per port.
- **VLAN:** Set the priority of traffic by VLAN.

Name	Description
① Cos:	Set the CoS priority level 0~7.
② ToS-Only:	System provides 0~63 ToS priority level.
③ ToS-First:	System provides 0~63 ToS priority level. Each level has 8 type of priority - 0~7. The default value is "1" priority for each level. When the IP packet is received, the system will check the ToS level value in the IP packet has received. For example: user set the ToS level 25 is 7. The port 1 is following the ToS priority policy only. When the packet received by port 1, the system will check the ToS value of the received IP packet. If the ToS value of received IP packet is 25 (priority = 7), and then the packet priority will have highest priority.
④ Port Based:	Define the priority by switch port.
⑤ VLAN	Define the priority by VLAN tag.
Based:	

9.Security

The “Security” menu contains the dialogs, displays and tables for configuring the security settings:

- Mac Address Tables
- Access Control List
- IEEE 802.1X Radius Server
- IP Security

9.1 MAC Address Tables

Use the MAC address table to ensure the port security.

Static MAC Address

You can add a static MAC address; it remains in the switch's address table, regardless of whether the device is physically connected to the switch. This saves the switch from having to re-learn a device's MAC address when the disconnected or powered-off device is active on the network again. You can add / modify / delete a static MAC address.

MAC Address Tables

Static MAC Addresses **MAC Filtering** All MAC Addresses

0 static MAC address entries

MAC Address	VLAN ID	Port No.	
<div> <div>1</div> <div>MAC address</div> <div>Please enter a valid MAC address.</div> </div>	<div> <div>2</div> <div>1</div> </div>	<div> <div>3</div> <div>Port 1</div> </div>	<div> <div>4</div> <div>+</div> </div>

Apply

Name	Description
① Mac Address:	Enter the MAC address of the port that should permanently forward traffic.
② VLAN ID:	Enter the corresponding VLAN ID.
③ Port No.:	Drop down menu for selecting the port.
④ +:	Add a new entry in static MAC address table

MAC Filtering

MAC Filtering helps to filter pre-configured MAC address and therefore enhances safety. You can add and delete filtering MAC address.

Static MAC Addresses **MAC Filtering** All MAC Addresses

0 entries

MAC Address	VLAN ID

9.3 IEEE 802.1X Radius Server

IEEE 802.1X defines a protocol for client/server-based access control and authentication. The protocol restricts unauthorized clients from connecting to a LAN through ports that are open to the Internet, and which otherwise would be readily accessible. The purpose of the authentication server is to check each client that requests access to the port. The client is only allowed access to the port if the client's permission is authenticated.

Radius Server

⑤ IPs/ Ranges:	Assign up to 20 specific IP addresses to be allowed or denied to access the admin service(s).				

10. VLAN

A virtual LAN (VLAN) is any broadcast domain that is partitioned and isolated in a computer network at the data link layer (OSI layer 2). LAN is the abbreviation for local area network and in this context virtual refers to a physical object recreated and altered by additional logic. VLANs work through tags within network packets and tag handling in networking systems - recreating the appearance and functionality of network traffic that is physically on a single network but acts as if it is split between separate networks. In this way, VLANs can keep networks separate despite being connected to the same network, and without requiring multiple sets of cabling and networking devices to be deployed.

VLANs allow network administrators to group hosts together even if the hosts are not on the same network switch. This can greatly simplify network design and deployment, because VLAN membership can be configured through software. Without VLANs, grouping hosts according to their resource needs necessitates the labor of relocating nodes or rewiring data links. It also has benefits in allowing networks and devices that must be kept separate to share the same physical cabling without interacting, for reasons of simplicity, security, traffic management, or economy. For example, a VLAN could be used to separate traffic within a business due to users, and due to network administrators, or between types of traffic, so that users or low priority traffic cannot directly affect the rest of the network's functioning. Many Internet hosting services use VLANs to separate their customers' private zones from each other, allowing each customer's servers to be grouped together in a single network segment while being located anywhere in their datacenter. Some precautions are needed to prevent traffic "escaping" from a given VLAN, an exploit known as VLAN hopping.

The VLAN membership configuration for the switch can be monitored and modified here. Up to 4094 VLANs are supported. This panel allows for adding and deleting VLANs as well as adding and deleting port members of each VLAN.

802.1Q GVRP

Enable GVRP ☒

GVRP (GARP VLAN Registration Protocol or Generic VLAN Registration Protocol) is a protocol that facilitates control of virtual local area networks (VLANs) within a larger network . GVRP conforms to the IEEE 802.1Q specification, which defines a method of tagging frames with VLAN configuration data. This allows network devices to dynamically exchange VLAN configuration information with other devices.

Enable GVRP option with all switches, those switch will synchronize the setting of VLAN trunk port with each other.

10.3 802.1Q VLAN Config

VLAN Config

Operation Mode 802.1Q VLAN

802.1Q VLAN Config

Management VLAN ID **①** 0

Port No.	② Link Type	③ PVID	④ Tagged VLANs
1	Access	1	
2	Access	1	
3	Access	1	
4	Access	1	
5	Access	1	
6	Access	1	

Name	Description
① Management VLAN ID:	Define which VLAN group member can access the switch, 0 means all VLAN group
② Link Type:	There are 3 types of link type: 1. Access Link: A segment which provides the link path for one

or more stations to the VLAN-aware device. An Access Port (untagged port), connected to the access link, has an untagged VID (also called PVID). After an untagged frame gets into the access port, the switch will insert a four-byte tag in the frame. The contents of the last 12-bit of the tag is untagged VID. When this frame is sent out through any of the access port of the same PVID, the switch will remove the tag from the frame to recover it to what it was. Those ports of the same untagged VID are regarded as the same VLAN group members.

2. **Trunk Link:** A segment which provides the link path for one or more VLAN-aware devices (switches). A Trunk Port, connected to the trunk link, has an understanding of tagged frame, which is used for the communication among VLANs across switches. Which frames of the specified VIDs will be forwarded depends on the values filled in the Tagged VID column field. Please insert a comma between two VIDs.
 3. **Hybrid Link:** A segment which consists of Access and Trunk links. The hybrid port has both the features of access and trunk ports. A hybrid port has a PVID belonging to a particular VLAN, and it also forwards the specified tagged-frames for the purpose of VLAN communication across switches.
 4. **QinQ Tunnel:** A Q-in-Q VLAN tunnel enables a service provider to segregate the traffic of different customers in their infrastructure, while still giving the customer a full range of VLANs for their internal use by adding a second 802.1Q tag to an already tagged frame.
 5. **QinQ Trunk:** When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network. Access interfaces are assumed to be customer-facing and accept both tagged and untagged frames.
-

Note: *Because the access port doesn't have an understanding of tagged frame, the column field of Tagged VID is not available.*

Note: *A trunk port doesn't insert tag into an untagged frame, and therefore the untagged VID column field is not available. It's not necessary to type '1' in the tagged VID. The trunk port will forward the frames of VLAN 1. The trunk port has to be connected to a trunk/hybrid port of the other switch. Both the tagged VID of the two ports have to be the same.*

-

11. GMRP

GARP was defined by the IEEE 802.1 working group to provide a generic framework allowing bridges (or other devices like switches) to register and de-register attribute values, like VLAN identifiers and multicast group membership. GARP defines the architecture, rules of operation, state machines and variables for the registration and de-registration of attribute values. GARP was used by two applications: GARP VLAN Registration Protocol (GVRP) for registering VLAN trunking between multilayer switches, and by the GARP Multicast Registration Protocol (GMRP). The latter two were both mostly enhancements for VLAN-aware switches per definition in IEEE 802.1Q.

GMRP Configuration

13. LLDP

The Link Layer Discovery Protocol (LLDP) is a link layer protocol in the Internet Protocol Suite used by switches to propagate their identity, capabilities, and neighbors on wired Ethernet network. The protocol is formally referred to by the IEEE as Station and Media Access Control Connectivity Discovery specified in IEEE 802.1AB and IEEE 802.3-2012 section 6 clause 79.

13.1 LLDP Configuration

LLDP Configuration

Enabled **1** ☒

TX Interval(secs) **2**

2	2	Both

Name	Description
1 Enabled:	Enabled the switch to send out LLDP information, and will analyze LLDP information received from neighbours.
2 Tx Interval:	The switch periodically transmits LLDP frames to its neighbours for having the network discovery information up-to-dated. The interval between each LLDP frame is determined by the Tx Interval value. Valid values are restricted to 5 - 3600 seconds.

③ Port No:	The switch port number for LLDP mode.
④ Port ID:	Input identification number of LLDP port.
⑤ Mode:	Select LLDP mode. <ul style="list-style-type: none"> ■ Rx only: The switch port will only get LLDP information from neighbors. ■ Tx only: The switch port will only send out LLDP information to neighbors. ■ Disabled: The switch port will not send out LLDP information, and will drop LLDP information received from neighbors. ■ Both: The switch port will send out LLDP information, and will analyze LLDP information received from neighbors.

13.2 LLDP Neighbor Information

LLDP Neighbor Information

Identification						
Local Port	Chassis ID	Port ID	Port Description	System Name	System Capability	Management Address
①	②	③	④	⑤	⑥	⑦

This page provides a status-quo for all LLDP neighbors. The table shows the LLDP neighbor information that contains the followings:

Name	Description
① Local Port:	The port which the LLDP frame was received.
② Chassis ID:	The identification of the neighbor's LLDP frames.
③ Port ID:	The identification number of the neighbor port.
④ Port Description:	The description that is advertised by the neighbor unit.
⑤ System Name:	The name advertised by the neighbor unit.
⑥ System Capability:	It describes the neighbor unit's capabilities which include the

- Capabilities:** followings:
1. Other
 2. Repeater
 3. Bridge
 4. WLAN Access Point
 5. Router
 6. Telephone
 7. DOCSIS cable device
 8. Station only
 9. Reserved

When a capability is enabled, the capability is shown (+). If the capability is disabled, the capability is shown (-).

7 Management Address: Management Address is the neighbor unit's address that is used for higher layer entities to assist discovery by the network management. This could for instance hold the neighbor's IP address.

13.3 LLDP Neighbor Information

This page provides an overview of all LLDP traffic.

LLDP Statistics

1	2	3	4	5	6	7	8	9	10
Port Number	Neighbors Aged Out	Neighbors Add	Neighbors Delete	Frames Discarded	Frames Received In Error	Frames In	Frames Out	TLVs Discarded	TLVs Unrecogniz
1	11	11	11	0	0	55	55	0	0
2	11	11	11	0	0	55	55	0	0
3	0	0	0	0	0	0	0	0	0

There are two types of counters are shown. **Total** is the counters that refer to the whole stack, switch, while **Ports** refer to per port counters for the selected switch.

Name	Description
------	-------------

1 Port	The port which LLDP frames are received or transmitted.
---------------	---

Number:

② Neighbors Aged Out:	Shows the number of entries deleted due to Time-To-Live expiration
③ Neighbors Added:	Shows the number of new entries added since switch reboot.
④ Neighbors Deleted:	Shows the number of new entries deleted since switch reboot.
⑤ Frames Discarded:	If an LLDP frame is received on a port, and the switch's internal table has run full, the LLDP frame is counted and will be discarded. This situation is known as "Too Many Neighbors" in the LLDP standard. LLDP frames require a new entry in the table when the Chassis ID or Remote Port ID is not already contained within the table. Entries are removed from the table when a given port's link is down, an LLDP shutdown frame is received, or when the entry ages out.
⑥ Frames Received In Error:	The number of received LLDP frames contains some kind of error.
⑦ Frames In:	The number of LLDP frames received on the port.
⑧ Frames Out:	The number of LLDP frames transmitted on the port.
⑨ TLVs Discarded:	Each LLDP frame can contain multiple pieces of information, known as TLVs (TLV is short for "Type Length Value"). If a TLV is malformed, it is counted and discarded.
⑩ TLVs Unrecognized:	The number of well-formed TLVs, but with an unknown type value.

14. Cisco Discovery Protocol (CDP)

Cisco Discovery Protocol (CDP) is a proprietary Data Link Layer protocol developed by Cisco Systems. It is used to share information about other directly connected Cisco equipment, such as the operating system version and IP address. CDP can also be used for On-Demand Routing, which is a method of including routing information in CDP announcements so that dynamic routing protocols do not need to be used in simple networks.

Cisco devices send CDP announcements to the multicast destination address 01-00-0c-cc-cc-cc, out each connected network interface. These multicast frames may be received by Cisco switches and other networking devices that support CDP into their connected network interface. This multicast destination is also used in other Cisco protocols such as Virtual Local Area Network (VLAN) Trunking Protocol (VTP). By default, CDP announcements are sent every 60 seconds on interfaces that support Subnetwork Access Protocol (SNAP) headers, including Ethernet, Frame Relay and Asynchronous Transfer Mode (ATM). Each Cisco device that supports CDP stores the information received from other devices in a table that can be viewed using the `show cdp neighbors` command. This table is also accessible via Simple Network Management Protocol (SNMP). The CDP table information is refreshed each time an announcement is received, and the holdtime for that entry is reinitialized. The holdtime specifies the lifetime of an entry in the table - if no announcements are received from a device for a period in excess of the holdtime, the device information is discarded (default 180 seconds).

The information contained in CDP announcements varies by the type of device and the version of the operating system running on it. This information may include the operating system version, hostname, every address (i.e. IP address) from all protocol(s) configured on the port where CDP frame is sent, the port identifier from

which the announcement was sent, device type and model, duplex setting, VTP domain, native VLAN, power draw (for Power over Ethernet devices), and other device specific information. The details contained in these announcements are easily extended due to the use of the type-length-value (TLV) frame format.

Note: Cisco is registered trademarks of Cisco Systems in the United States and/or other countries.

The above info is taken from Wiki at

https://en.wikipedia.org/wiki/Cisco_Discovery_Protocol

Version:

⑨ Addresses:	The neighbor unit's address that is used for higher layer entities to assist discovery by the network management. This could for instance hold the neighbor's IP address.
---------------------	---

15. IGMP Snooping

By default, all Multicast traffic should be blocked until requested by a Multicast group member. (Default behavior depends on switch manufacturer.) The master of the IGMP filter lists is the router or switch that is configured to act as the IGMP Querier. The responsibility of the Querier is to send out IGMP group membership queries on a timed interval, to retrieve IGMP membership reports from active members, and to allow updating of the group membership tables.

Without IGMP Querying/Snooping, Multicast traffic is treated in the same manner as a Broadcast transmission, which forwards packets to all ports on the network. With IGMP Querying/Snooping, Multicast traffic is only forwarded to ports that are members of that Multicast group. IGMP Snooping generates no additional network traffic, which significantly reduces the Multicast traffic passing through your switch.

Lantech switches support IGMP Snooping that can snoop IGMP Query, report, and leave (IGMP version 2) between Multicast switches and Multicast hosts to determine the Multicast group membership. IGMP snooping function is able to check IGMP packets passing through the network, generate the table holding the member ports for each a multicast group.

15.1.1. Global Configuration

Name	Description
① Enabled Querier:	Enable IGMP Querier with switch.
② Enabled Snooping:	Enable IGMP Snooping with switch.
③ Enable Unregister Flooding:	Set switch to flood all unregistered Multicast data.
④ Flood Well-known Multicast Traffic:	Set switch to flood all dedicated Multicast data. Please refer to help file for info about dedicated Multicast data

Help file of IGMP Snooping Configuration

15.1.2. Port Related Configuration

Name	Description
⑤ Port:	The switch port number
⑥ Router Port:	Switch will forward all Multicast stream to router port
⑦ Fast Leave:	Enable the fast leave on the port.

Fast Leave: A device sends IGMP leave packet (IGMP v2) to switch, the switch then sends a group query to confirm if any device (host) is left without response.

15.2 IGMP Snooping Status

This page provides IGMP Snooping status.

IGMP Snooping Status

false

Clear

15.2.1. Statistics

Name	Description
❶ VLAN ID:	The VLAN ID of the entry.
❷ Status	Shows the Querier status is "ACTIVE" or "IDLE".
Querier:	
❸ Queries	The number of Transmitted Queries.
Transmitted:	
❹ Queries	The number of Received Queries.
Received:	
❺ V1 Reports	The number of Received IGMP V1 Reports.
Received:	
❻ V2 Reports	The number of Received IGMP V2 Reports.
Received:	
❼ V3 Reports	The number of Received IGMP V3 Reports.
Received:	

⑧ V2 Leaves The number of Received IGMP V2 Leaves.

Received:

15.2.2. IGMP Groups

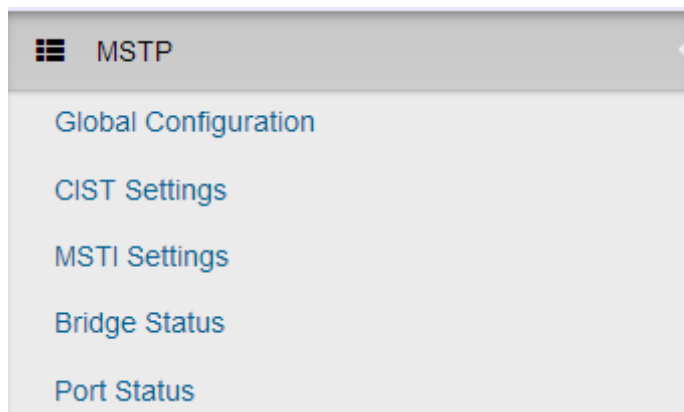

Entries in the IGMP group table is shown on this page

IGMP Groups

① VLAN ID	② Multicast Address	③ Port Members	④ Membership Interval
------------------	----------------------------	-----------------------	------------------------------

Name	Description
① VLAN ID:	VLAN ID of the IGMP group
② Multicast	Multicast address of the IGMP group
Addresses:	
③ Port	Ports under this IGMP group
Members:	
④ Membership Interval:	The IGMP table refresh time. The default interval time is 260 seconds

16. MSTP

The Spanning Tree Protocol (STP) is a network protocol that builds a logical loop-free topology for Ethernet networks. The basic function of STP is to prevent bridge loops and the broadcast radiation that results from them. Spanning tree also allows a network design to include spare (redundant) links to provide automatic backup paths if an active link fails. This is done without the danger of bridge loops, or the need for manual enabling or disabling of these backup links.

STP creates a spanning tree within a network of connected layer-2 bridges, and disables those links that are not part of the spanning tree, leaving a single active path between any two network nodes.

Within STP, the detection and reconfiguration of network topology (connection lost, add a new switch etc) will takes some time – like 30-50 seconds. However, many time-sensitive applications cannot tolerate such delay of network down time, Rapid Spanning Tree Protocol (RSTP) was conceived to overcome this problem (RSTP takes 5-6 seconds to update and re-configure the new network topology/ routes).

In RSTP, link status of each port is monitored pro-actively (instead of waiting for the BPDU messages) to detect network topology changes for achieving faster reaction. RSTP is backward compatible with STP switches.

MSTP (Multiple Spanning Tree Protocol) can map a group of VLAN's into a single Multiple Spanning Tree instance (MSTI), i.e. the Spanning Tree Protocol is applied

separately for a set of VLAN's instead of the whole network. Different root switches and different STP parameters can be individually configured for each MSTI, so one link can be active for one MSTI and the other link active for the second MSTI, this enables some degree of load-balancing and in general two MSTI's are used in the network for easier implementation.

Note: This section is taken from Wiki at

https://en.wikipedia.org/wiki/Spanning_Tree_Protocol

16.1 MSTP Global Configuration

MSTP Global Configuration

Mode ❶

Name ❷

Revision ❸

Max Age ❹

Forward Delay ❺

Max Hops ❻

Name	Description				
❶ Mode:	Select STP or RSTP or MSTP redundancy protocol for network.				
	<table> <tr> <th>Variants</th><th>Default Setting</th></tr> <tr> <td>STP, RSTP, MSTP</td><td>MSTP</td></tr> </table>	Variants	Default Setting	STP, RSTP, MSTP	MSTP
Variants	Default Setting				
STP, RSTP, MSTP	MSTP				
❷ Name:	MSTP name for purpose of identifying VLAN to MSTI mapping. Bridges must match the name and revision, as well as the VLAN-to-MSTI mapping configuration in order to share spanning trees for MSTI's (Intra-region). The name column is up to 32 characters.				

③ Revision:	The revision of the MSTP configuration named above. This must be an integer between 0 and 65535.
④ Max Age:	The maximum age time of the information transmitted by the Bridge when it is the Root Bridge. Valid values are in the range 6 to 40 seconds, and MaxAge must be $\leq (\text{FwdDelay}-1)*2$.
⑤ Forward Delay:	The delay used by STP Bridges to transit Root and Designated Ports to Forwarding (used in STP compatible mode). Valid values are in the range 4 to 30 seconds.
⑥ Max Hop :	The initial value of remaining Hops for MSTI information generated at the boundary of an MSTI region. It defines how many bridges a root bridge can distribute its BPDU information to. Valid values are in the range 6 to 40 hops.

16.2 CIST Settings

How to enable STP/RSTP

- Select STP or RSTP in MSTP Global Configuration
- Press icon to enable STP under CIST Settings

Note: The default was disabled with all ports.

The screenshot displays the 'Port Configuration' page in the Lantech Web UI. The left sidebar contains a navigation menu with the following items: QoS, Security, VLAN, MVR, LLDP, IGMP Snooping, CDP, MSTP (selected), Global Configuration, CIST Settings, MSTI Settings, Bridge Status, Port Status, Aggregation, PTP, and G 8032 FRPS. The main content area shows a table with 10 ports, each with a 'Port NO' from 1 to 10. The 'Enable STP' column for all ports is set to 'NO'. A tooltip 'Enable STP on all ports' is visible over the 'Enable STP' column header. The table also includes columns for 'Path Cost', 'Priority', 'Edge Mode', and 'P2P Mode'. The 'Priority' column is set to 128 for all ports, and 'Edge Mode' and 'P2P Mode' are set to 'Force Enabled'.

Port NO	Enable STP	Path Cost	Priority	Edge Mode	P2P Mode
1	NO	0	128	Force Enabled	Force Enabled
2	NO	0	128	Force Enabled	Force Enabled
3	NO	0	128	Force Enabled	Force Enabled
4	NO	0	128	Force Enabled	Force Enabled
5	NO	0	128	Force Enabled	Force Enabled
6	NO	0	128	Force Enabled	Force Enabled
7	NO	0	128	Force Enabled	Force Enabled
8	NO	0	128	Force Enabled	Force Enabled
9	NO	0	128	Force Enabled	Force Enabled
10	NO	0	128	Force Enabled	Force Enabled

How to enable MSTP

- A. Select MSTP in MSTP Global Configuration
- B. Press icon to enable STP under CIST Settings

Note: The default was disabled with all ports.

The screenshot shows the web UI interface. On the left is a navigation menu with categories like QoS, Security, VLAN, MVR, LLDP, IGMP Snooping, CDP, MSTP, Aggregation, PTP, and G.8032 FRPS. The MSTP section is expanded, showing sub-items: Global Configuration, CIST Settings, MSTI Settings, Bridge Status, and Port Status. The main content area displays the 'Port Configuration' table. Above the table, there is a 'Priority' field set to 32768 and a button labeled 'Enable STP on all ports' with a checkmark icon. The table has columns: Port NO, Enable STP, Path Cost, Priority, Edge Mode, and P2P Mode. All 10 ports have 'Enable STP' set to 'NO'.

Port NO	Enable STP	Path Cost	Priority	Edge Mode	P2P Mode
1	NO	0	128	Force Enabled	Force Enabled
2	NO	0	128	Force Enabled	Force Enabled
3	NO	0	128	Force Enabled	Force Enabled
4	NO	0	128	Force Enabled	Force Enabled
5	NO	0	128	Force Enabled	Force Enabled
6	NO	0	128	Force Enabled	Force Enabled
7	NO	0	128	Force Enabled	Force Enabled
8	NO	0	128	Force Enabled	Force Enabled
9	NO	0	128	Force Enabled	Force Enabled
10	NO	0	128	Force Enabled	Force Enabled

- C. Check the status of STP, all ports should change to “Yes”

The screenshot shows the web UI interface after enabling STP. The navigation menu is the same. The main content area displays the 'Port Configuration' table. Above the table, there is a button labeled 'Disable STP on all ports' with an 'x' icon. The table has columns: Port NO, Enable STP, Path Cost, Priority, Edge Mode, and P2P Mode. All 10 ports now have 'Enable STP' set to 'YES'.

Port NO	Enable STP	Path Cost	Priority	Edge Mode	P2P Mode
1	YES	0	128	Force Enabled	Force Enabled
2	YES	0	128	Force Enabled	Force Enabled
3	YES	0	128	Force Enabled	Force Enabled
4	YES	0	128	Force Enabled	Force Enabled
5	YES	0	128	Force Enabled	Force Enabled
6	YES	0	128	Force Enabled	Force Enabled
7	YES	0	128	Force Enabled	Force Enabled
8	YES	0	128	Force Enabled	Force Enabled
9	YES	0	128	Force Enabled	Force Enabled
10	YES	0	128	Force Enabled	Force Enabled

Port 1	YES	0	128	Force Enabled	Force Enabled
Port 2	YES	0	128	Force Enabled	Force Enabled
Port 3	YES	0	128	Force Enabled	Force Enabled
Port 4	YES	0	128	Force Enabled	Force Enabled

16.2.1. Bridge configuration

Name	Description
① VLANs :	The list of VLANs mapped to the MSTI. The VLANs must be separated with comma and/or space. A VLAN can only be mapped to one MSTI. An unused MSTI should just be left empty. (I.e. not having any VLANs mapped to it.) Unmapped VLANs are mapped to the CIST. (The default bridge instance).
② Priority:	Controls the bridge priority. Lower numeric values have better priority. The bridge priority plus the MSTI instance number,

concatenated with the 6-byte MAC address of the switch forms a Bridge Identifier.

16.2.2. Port Configuration

Name	Description
③ Port No:	The switch port number of STP.
④ Enabled	Controls whether STP is enabled with this switch port.
STP:	
⑤ Path Cost:	Controls the path cost incurred by the port. The Auto setting will set the path cost appropriate by the physical link speed, using the 802.1D recommended values.
⑥ Priority:	Controls the port priority. This can be used to control priority of ports having identical path cost. (See above).
⑦ edge_mode:	The port which connects with ending device
⑧ p2p_mode:	The port which connects with another switch

16.3 MSTP MSTI Settings

MSTP MSTI Settings

① Instance NO

② VLANs

③ Priority

Add

Name	Description
① Instance No:	Index number of MSTP instance
② VLANs:	The list of VLANs mapped to the MSTI. A VLAN can only be mapped to one MSTI. Unmapped VLANs are mapped to the CIST. (The default bridge instance).

③ Priority:	Controls the bridge priority. Lower numeric values have better priority.
--------------------	--

16.4 MSTP Bridges Status

MSTP Bridges Status

① NO	② Bridge ID	③ Root ID	④ Root Port	⑤ Root Cost	⑥ Topology State
CIST 0	32768-	32768-	0	0	

Name	Description
① NO:	The number of MSTP instance
② Bridge ID:	The ID of this Bridge instance.
③ Root ID:	The ID of the currently elected root bridge.
④ Root Port:	The switch port as the root port role.
⑤ Root Cost:	Root Path Cost. For the Root Bridge it is zero. For all other Bridges, it is the sum of the Port Path Costs on the least cost path to the Root Bridge.
⑥ Topology State:	The current state of the Topology.

16.5 Bridge status of all ports

Bridge status of all ports

① Port 1 as Designated/FORWARDING in CIST	Port 2 as Disabled/BLOCKING in CIST	Port 3 as Disabled/BLOCKING in CIST
Port 4 as Disabled/BLOCKING in CIST	Port 5 as Disabled/BLOCKING in CIST	Port 6 as Disabled/BLOCKING in CIST
Port 7 as Designated/FORWARDING in CIST	Port 8 as Disabled/BLOCKING in CIST	Port 9 as Disabled/BLOCKING in CIST
Port 10 as Disabled/BLOCKING in CIST	Port 11 as Disabled/BLOCKING in CIST	Port 12 as Disabled/BLOCKING in CIST

Name	Description				
❶ Port:	The switch port number of STP port.				
❷ Role:	<p>The current STP port role of the port. The port role can be one of the following Variants:</p> <table data-bbox="419 483 1361 703"> <tr> <th data-bbox="419 483 887 535">Variants</th><th data-bbox="887 483 1361 535">Default Setting</th></tr> <tr> <td data-bbox="419 535 887 703">AlternatePort, BackupPort, RootPort, DesignatedPort, Disabled</td><td data-bbox="887 535 1361 703">Per current status</td></tr> </table>	Variants	Default Setting	AlternatePort, BackupPort, RootPort, DesignatedPort, Disabled	Per current status

❸ State:	<p>The current STP port state of the port. The port state can be one of the following Variants:</p> <table data-bbox="419 815 1361 976"> <tr> <th data-bbox="419 815 887 866">Variants</th><th data-bbox="887 815 1361 866">Default Setting</th></tr> <tr> <td data-bbox="419 866 887 976">Discarding, Learning, Forwarding, Blocking</td><td data-bbox="887 866 1361 976">Per current status</td></tr> </table>	Variants	Default Setting	Discarding, Learning, Forwarding, Blocking	Per current status
Variants	Default Setting				
Discarding, Learning, Forwarding, Blocking	Per current status				

17. Link Aggregation

In computer networking, the term link aggregation applies to various methods of combining (aggregating) multiple network connections in parallel in order to increase throughput beyond what a single connection could sustain, and to provide redundancy in case one of the links should fail. A Link Aggregation Group (LAG) combines a number of physical ports together to make a single high-bandwidth data path, so as to implement the traffic load sharing among the member ports in the group and to enhance the connection reliability.

Other umbrella terms used to describe the method include port trunking ,link bundling, Ethernet/network/NIC bonding ,or NIC teaming. These umbrella terms encompass not only vendor-independent standards such as Link Aggregation Control Protocol (LACP) for Ethernet defined in IEEE 802.3ad standard, but also various proprietary solutions.

Note: This section is taken from Wiki at https://en.wikipedia.org/wiki/Link_aggregation

Members:	

17.2 LACP Group Status

Name	Description
1 Trunking Group	Number of trunk group
2 LACP	'Yes' means that LACP is enabled and the port link is up. 'No' means that LACP is not enabled or the port link is down.
3 System ID	The ID of each Trunk group
4 Port Members	Switch ports which bind the trunk group

18. PTP

The Precision Time Protocol (PTP) is a protocol used to synchronize clocks throughout a computer network. On a local area network, it achieves clock accuracy in the sub-microsecond range, making it suitable for measurement and control systems.

PTP was originally defined in the IEEE 1588-2002 standard, officially entitled "Standard for a Precision Clock Synchronization Protocol for Networked Measurement and Control Systems" and published in 2002. In 2008, IEEE 1588-2008 was released as a revised standard; also known as PTP Version 2, it improves accuracy, precision and robustness but is not backward compatible with the original 2002 version.

"IEEE 1588 is designed to fill a niche not well served by either of the two dominant protocols, NTP and GPS. IEEE 1588 is designed for local systems requiring accuracies beyond those attainable using NTP. It is also designed for applications that cannot bear the cost of a GPS receiver at each node, or for which GPS signals are inaccessible."

Note: this section is taken from WIKI at

https://en.wikipedia.org/wiki/Precision_Time_Protocol

There are two modes in IEEE1588 PTP, Two-step PTP and One-step PTP. Two-step PTP will add the time-stamp value on synchronized message via CPU to slave while One-step PTP sends a synchronized message straight to slave by hardware PHY without going through CPU.

Note: PTP is an optional hardware function for Lantech switch. Please check your model if it supports PTP.

PTP Transparent Clock Configuration

Mode ①

Enable on ②

Name	Description				
① Mode:	Currently switch only support P2P mode				
	<table> <tr> <th>Variants</th><th>Default Setting</th></tr> <tr> <td>E2E/P2P</td><td>P2P</td></tr> </table>	Variants	Default Setting	E2E/P2P	P2P
Variants	Default Setting

② Enable on:	Select switch port(s) which you want to active PTP mode. Note : PTP mode is supported only on Gigabit port, please check the model specification for supported PTP Gigabit port by Cooper or Fiber or Both				

19. G.8032 Ethernet Ring Protection (ERPS)

Ethernet Ring Protection Switching, or ERPS, is an effort at ITU-T under G.8032 Recommendation to provide sub-50ms protection and recovery switching for Ethernet traffic in a ring topology and at the same time ensuring that there are no loops formed at the Ethernet layer. G.8032v1 supported a single ring topology and G.8032v2 supports multiple rings/ladder topology.

Loop avoidance in an Ethernet Ring is achieved by guaranteeing that, at any time, traffic may flow on all but one of the ring links. This particular link is called the Ring Protection Link (RPL), and under normal conditions this ring link is blocked, i.e. not used for service traffic. One designated Ethernet Ring Node, the RPL Owner Node, is responsible for blocking traffic at one end of the RPL. Under an Ethernet ring failure condition, the RPL Owner Node is responsible for unblocking its end of the RPL (unless the RPL has failed) allowing the RPL to be used for traffic. The other Ethernet Ring Node adjacent to the RPL, the RPL Neighbour Node, may also participate in blocking or unblocking its end of the RPL.

The event of an Ethernet Ring failure results in protection switching of the traffic. This is achieved under the control of the ETH_FF functions on all Ethernet Ring Nodes. An APS protocol is used to coordinate the protection actions over the ring.

Note: This section is taken from WIKI at https://en.wikipedia.org/wiki/Ethernet_Ring_Protection_Switching

Lantech ERPS ring consists of five (5) modes including Auto, Basic, Enhanced, Multiple-VLAN, Multiple-Train modes. Only the Basic and Multiple-VLAN modes are compatible with most of 3rd party switch that supports ERPS. The Auto, Enhanced

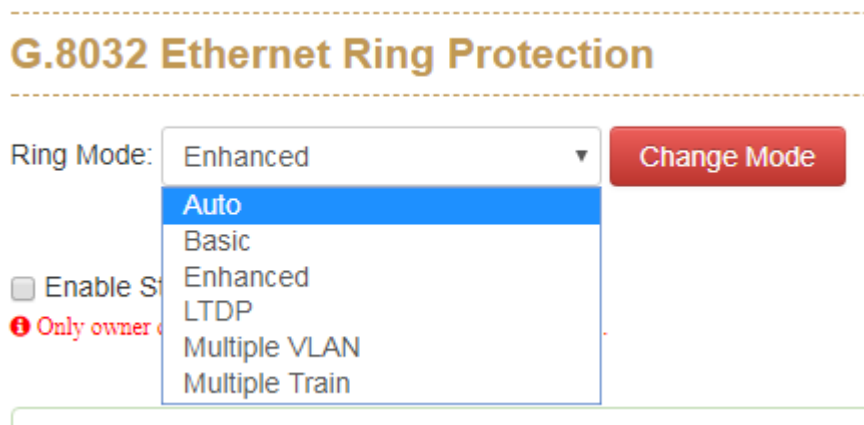

and Multiple-Train modes are Lantech proprietary protocols and can only be supported by Lantech 3 series and above switches. The ERPS ring modes may be varied in different switch models, please check the specification before use.

Lantech Auto, Enhanced and Multiple-Train ring are adapted to protect IGMP and data packets with faster recovery scheme, so if the network is in heavy duty of IGMP application, we suggest using those ring modes to achieve better redundancy.

Notice:

1. **Building ITU-Ring requires all uplink connections to use the same media, i.e.: all fiber ports or all copper ports. Inconsistent uplink media may cause ITU-Ring to fail.**
2. **Apart from consistent uplink media, the speed of uplink ports must be consistent too, i.e.: all 10/100 or all 10/100/1000. Inconsistent speed may cause ITU-Ring misjudgment and loop.**

19.1 Introduction of Ring modes

Auto Ring

Auto Ring applies with single ring topology only. The operator only need to assign ring ports with each switch, the other options will be defined automatically by switch.

Note: Please keep the setting of ID & Type as default because Auto Ring mode only supports single ring topology.

G.8032 Ethernet Ring Protection

Ring Mode: [Change Mode](#)

ID	Enabled	Role	Type
Editing Ring Instance 0

Node Failure Protection	<input type="checkbox"/>			
Detect Miswiring	<input type="checkbox"/>			

LTDP

LTDP is designed for dynamic installation environment of train application, beside fail uplink connection protection and node failure protection, it also support IP assign automatically and configuration backup and restore automatically.

G.8032 Ethernet Ring Protection

Ring Mode: LTDP

Change Mode

LTDP

1 Enabled: ☐

2 Master: ☐

3 Starting IP Address: 192.168.16.100

Ports:

4 Ring Port 0: Port 1

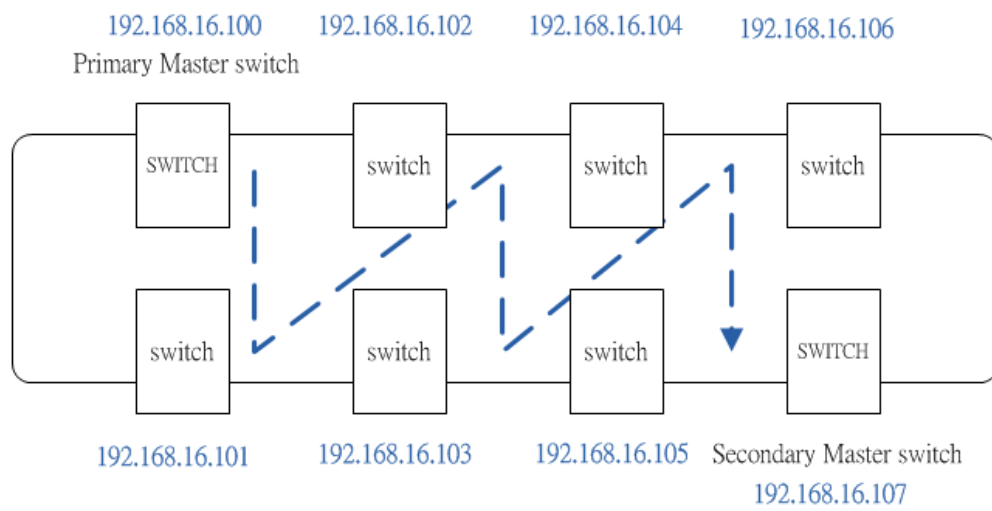

5 Ring Port 1: Port 2

Name	Description
① Enabled:	Enable LTDP
② Master:	Set master switch of LTDP
③ Starting IP address:	Set Starting IP address of IP range which you want to assign to all switches in field
④ Ring Port 0:	First Ring Port of LTDP
⑤ Ring Port 1:	Second Ring Port of LTDP.

Master: you need to assign 2 master switches in front carriage and end carriage, these 2 master switch will be responsible to assign IP address switch and backup configuration file of each switch. They will be backup with each other.

Starting IP address: Just need to set the first IP address of the IP range which you want to assign those switches, the primary master switch will assign IP address to all switches by the sequence of below diagram, remember all switches need to set the same IP address with this option.

Multiple VLAN

All rings (include Major ring and Sub ring) can be implemented with different VLAN.

This Multiple VLAN mode can be compatible with most of other brand switches.

Ring Mode:

ID	Enabled	Role	Type	VLAN
Editing Ring Instance 0				
ID	<input type="text" value="1"/>			
Ring Enabled	<input type="checkbox"/>			
Role	<input type="text" value="None"/>			
Type	<input type="text" value="Major"/>

Port 0	<input type="text" value="Port 1"/>			
Port 1	<input type="text" value="Port 2"/>			
Node Failure Protection	<input type="checkbox"/>			
Detect Miswiring	<input type="checkbox"/>			

Multiple Train Ring

Multi-Train Ring is designed for the redundancy network of train application, as above picture. Multiple train ring supports dynamic coupling topology that is able to couple two rings automatically which requires in train coupling applications.

Note: Train ring must consist of minimum four (4) Lantech switches in the conjunction ring.

G.8032 Ethernet Ring Protection

1 Ring Mode:	There are 5 modes can be chosen, switch need to be rebooted after mode changed				
	<table border="1"> <thead> <tr> <th>Variants</th><th>Default Setting</th></tr> </thead> <tbody> <tr> <td>Auto, Basic, Enhanced, LTDP, Multiple VLAN, Multiple Train</td><td>Enhanced</td></tr> </tbody> </table>	Variants	Default Setting	Auto, Basic, Enhanced, LTDP, Multiple VLAN, Multiple Train	Enhanced
Variants	Default Setting				
Auto, Basic, Enhanced, LTDP, Multiple VLAN, Multiple Train	Enhanced				
2 Enable Storm Control:	This function only can be activated by owner switch. If owner switch detects loop issue, it will force to disable RPL port. It can only be enabled with owner switch.				
3 ID:	The ID of the created protection group				
4 Enabled:	Enable/Disable the G.8032 ERPS.				
5 Role:	It can be either RPL owner or RPL Neighbor.				
6 Type:	Type of Protecting ring. It can be either major ring or sub-ring.				
7 VLAN:	VLAN of per ring , only available with Multiple VLAN mode.				
8 Ring Port 0:	This will create a Port 0 of the switch in the ring. Please refer to 18.4 for rule of setting port 0.				
9 Ring Port 1:	This will create "Ring Port 1" of the switch in the Ring. Please refer to 18.4 for rule of setting port 1.				
10 Node Failure Protection:	This option can avoid loop under circumstance of power outage to switches that will be rebooted after power restore. It can only be enabled with owner switch.				

① Detect Misswiring:	This option can prevent incorrect ring port wiring that is conflict with pre-set ring ports and incur loop issue.
-----------------------------	---

19.3 Setting Up and Configuring

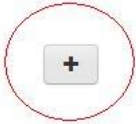

18.3.1. G.8032

Before Setup: Make sure you have disabled the MSTP protocol.

Note: in this case, we will use the port 9 and port 10 of each switch to build a ring.

1. Press “+” icon to add one ring with G.8032 protocol.

G.8032 Ethernet Ring Protection

ID	Enabled	Role	Type	Ring Port 0	Ring Port 1	
1	Disabled	None	Sub	Port 1	Port 2	

2. Enter edit mode

G.8032 Ethernet Ring Protection

ID	Enabled	Role	Type	Ring Port 0	Ring Port 1	
1	Disabled	None	Sub	Port 1	Port 2	 

3. Take an example of three switches in the ring of G.8032, one plays the role of “owner”, another for “neighbor” and the other for “none”, please remember three very import rules in the setting procedure:
 - the port0 of “owner” switch must connect with the “neighbor” switch.
 - After enable the ring of G8032, the port0 of owner switch will be blocked at first.

To play safe, we suggest the user to finished all setting G8032 then connect the physical connection if the user is not familiar with the G8032 function.

4. The setting of owner switch, remember to press “SAVE” and “APPLY” to confirm the setting. (For we only have single ring of three switches, so we set the type as Major)

ID	Enabled	Role	Type	Ring Port 0	Ring Port 1
1	<input checked="" type="checkbox"/>	Owner	Major	Port 9	Port 10

18.3.2. Multiple Train Ring

Step1: Enable ITU G.8032 to “Multiple Train” mode.

G.8032 Ethernet Ring Protection

Step2: Select ring ports

Example 1: Enable “Coupling Node” (Those 4 switches on right side are responsible to couple consist networks together)

G.8032 Ethernet Ring Protection

Ring Mode: Multiple Train ▼ Change Mode

Train Ring

Enabled: ☐

Coupling Node: ☒

Internal Ring:

Ports: Port 10 ▼ Port 11 ▼

Be sure that the first internal ring port is not connected to the shared line

Coupling Ring:

Internal: Port 11 ▼

External: Port 12 ▼

Example 2: Disable “Coupling Node” (The other switches of each STU)

19.4 Ring Status

Ring Status

ID	State	Role	Ring Port 0	Ring Port 1
①	②	③	④	⑤

Name	Description
① ID:	The ID of the created Protection group
② State:	ERPS state according to State Transition Tables in G.8032.
③ Role:	It can be either RPL owner or RPL Neighbor.
④ Ring Port 0:	true : ring port 0 is blocking false : ring port 0 is not blocking
⑤ Ring Port 1:	true : ring port 0 is blocking false : ring port 0 is not blocking

Note: If you have configured VLANs, Remember to set VLAN trunk port as ring port.

20. Dual Homing

This function was designed to connect ITU-Ring with the other redundancy protocol like STP、RSTP、MSTP.

Dual-Homing

ID	Enabled	Role	Port	
				+

Apply

Press “+” to add setting with Dual-Homing function.

ID	Enabled	Role	Port	
Editing Dual-Homing Instance 1				
ID ①	1			
Enabled ②	<input type="checkbox"/>			
Role ③	Primary			
Port ④	Port 1			

Name	Description
① ID:	The ID of Dual Homing connection

② Enable:	Enable the Dual Homing function of this port				
③ Role:	There should be 2 connections between RSTP with ITU-Ring, one set Primary, the other set Secondary. <table><tr><th>Variants</th><th>Default Setting</th></tr><tr><td>Primary/Secondary</td><td>Primary</td></tr></table>	Variants	Default Setting	Primary/Secondary	Primary
Variants	Default Setting				
Primary/Secondary	Primary				
④ Port:	The port connects to the switch which runs RSTP protocol.				

Note: There are max. two connections between ITU-Ring with other redundancy protocol and each switch only support single Dual-Homing connection.

21. Maintenance

- System Config Save: Save the settings.
- Config Backup/Restore: Download and upload the configuration file.
- Maintenance Reboot: Reboot the switch manually.
- Firmware Upgrade: Update the firmware.

20.1 Save Configuration

System Config Save

Click to save the settings.

20.2 Configuration Backup/Restore

Config Backup/Restore

① Settings Backup

Click button to download current settings

Download settings

② Settings Restore

Select the file previously backup to restore

Select File

③ Reset to default

Click button to reset to default settings

Restore to default

Keep IP & Account

Settings Backup

Settings Backup is for saving the entire configuration of a switch into YML format which can be edited by office utility.

Settings Restore

Settings Restore is for restoring the configuration from YML backup.

Name	Description				
① Settings	Download/ export the configuration from switch for back up.				
Backup:					
② Settings	Upload/ import a previous configuration to startup.				
Restore:					
③ Reset to default:	Reset the switch with four resetting options.				
	<table> <tr> <th>Resetting Options</th><th>Default Setting</th></tr> <tr> <td>Keep IP & Account,</td><td>Keep IP & Account</td></tr> </table>	Resetting Options	Default Setting	Keep IP & Account,	Keep IP & Account
Resetting Options	Default Setting				
Keep IP & Account,	Keep IP & Account				

	Keep User Accounts, Keep Network Configs, Restore Everything	
--	--	--

20.3 Restart Device (Maintaince Reboot)

Click to reboot the switch manually.

Maintaince Reboot

Restart Device

20.4 Firmware Upgrade

Update the switch by pressing "Select File" to browse computer and select the proper firmware. It will be taking 60 to 90 seconds to finish the work.

Firmware Upgrade

Select the firmwire file to upload

Select File

20.5 Diagnostics

Diagnosis panel contains the tables below and each of them helps technician to set up proper scenario for troubleshooting.

- Ping
- ARP Table

Ping

72 bytes from 192.168.9.1: seq=3 ttl=255 time=0.417 ms
--- 192.168.9.1 ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max = 0.417/2.328/8.048 ms

```

Name	Description
① Address:	Enter the IP address to ping.
② Count:	Enter how many times to ping the address.
③ Packet Size:	Enter the size of ping packet.

ARP Table

Address Resolution Protocol (ARP) helps to map an IP address to a MAC address that is recognized in the local network and ARP Table shows the list of pinged MAC address and its corresponding IP address.

The screenshot shows a web interface with a tab labeled "ARP Table". Below the tab is a table titled "ARP Table" containing two rows of data. Each row consists of a MAC address and an IP address, separated by a dashed line.

ARP Table	
00:1f:c6:3d:7e:be	192.168.9.47
00:50:7f:5a:3e:b8	192.168.9.1

Appendix — Command Line mode

Besides web access, Lantech switch also support console and Telnet access. However, both of console and Telnet access support only command line user interface, so, herewith the link to download the list of commands:

<http://www.lantechcom.tw/global/eng/download/datasheet/M-CLI.pdf>

Access via console port

When the connection between Switch and PC is ready, turn on the PC and run a terminal emulation program or **Hyper Terminal** and configure its **communication parameters** to match the following default characteristics of the console port:

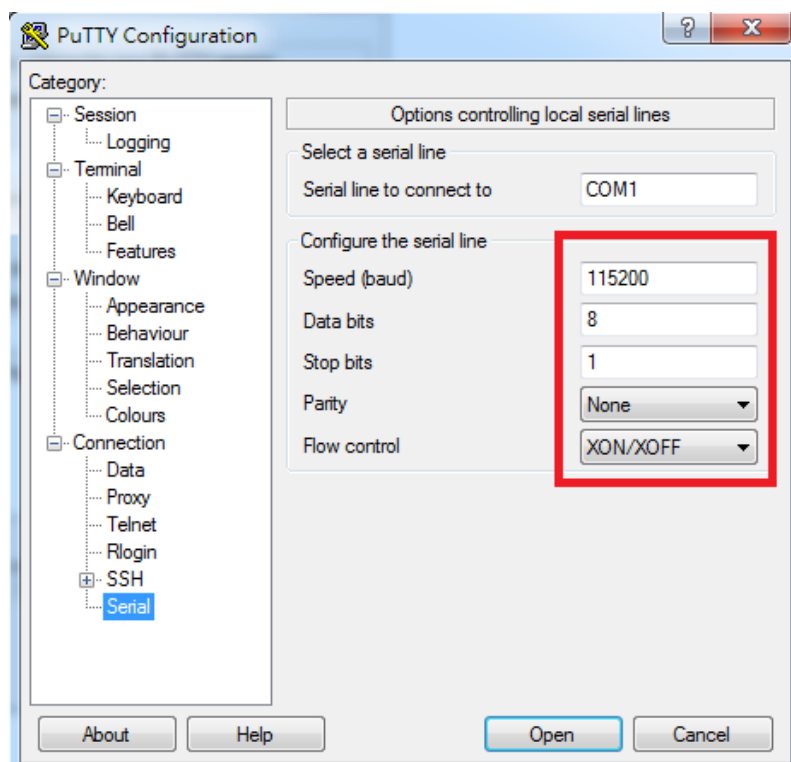

Baud Rate: 115200 bps

Data Bits: 8

Parity: none

Stop Bit: 1

Flow control: None

The settings of communication parameters

Click '**OK**' to complete the work and the blank screen will show up, when it does then press Enter key to have the login prompt appears. And now please key in "**cli**" to enter the command line mode and then key in '**admin**' (default value) for both Login and Password and press Enter to get to the interface of console management. Please refer to below picture for the login screen.

A screenshot of a terminal window with a black background and white text. At the top, there is a large, stylized logo made of white lines. Below the logo, the text "Lantech 2013" is displayed. The login process is shown with the following text: "login: cli", "Last login: Fri Jun 21 06:15:11 on pts/0", "Login : admin", "Password :", and "cur_login = admin". At the bottom, the text "Welcome to Command Line Interface." is shown, followed by a prompt ">_" on the next line.

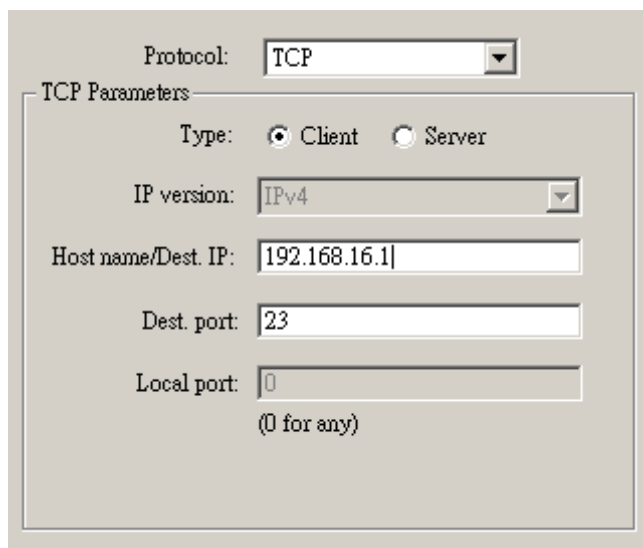

```
Lantech 2013

login: cli
Last login: Fri Jun 21 06:15:11 on pts/0
Login : admin
Password :
cur_login = admin

Welcome to Command Line Interface.
>_
```

Access via Telnet

Use Telnet utility to access switch IP and make sure the Dest. port is set to 23. All the commands under Telnet mode are the same to the Console mode.

Protocol:
